

To summarize the changes in northwestern farm product prices, it is most convenient to use the index number of Minnesota farm prices computed for the Agricultural Extension Division of the University of Minnesota. This index for February was 54.3, using 1924-26 as the base period. In January, the index was 46.0, and in February last year, the index was 34.8. According to this index, farm product prices in Minnesota were 56 per cent higher than a year ago, and 19 per cent higher than two years ago, but, as the index shows, they were 46 per cent below prices in the more normal years 1924-26.

Wheat Benefit Payments By AAA

In compensation to farmers who have signed agreements to reduce their wheat acreage for 1934, the Agricultural Adjustment Administration has paid \$14,045,316.46 to farmers in Minnesota, North Dakota, South Dakota and Montana during the past winter up to the end of February. In February alone the wheat benefit payments in these states amounted to \$8,309,707.17. To give some idea of the importance of these payments, it can be said that the February wheat benefit payments in this district were larger than the February income in the district from the sale of either dairy products, hogs or grain and potatoes. Obviously these payments were a major factor in stimulating business activity in the wheat-raising portions of the district.

Wheat Benefit Payments

	Month of Feb., 1934	Season up to Feb. 28, 1934
Minnesota	\$ 142,405.01	\$ 1,191,277.85
Montana	2,326,927.45	3,209,505.95
North Dakota	5,416,834.38	6,376,209.35
South Dakota	423,540.33	3,268,323.31
Four State Total.....	\$ 8,309,707.17	\$14,045,316.46
United States Total.....	14,316,496.31	59,635,216.43

Livestock Marketings

Receipts of cattle at South St. Paul during February continued in about the same volume as in January but were somewhat larger than in February last year. Total slaughter of cattle under Federal inspection in the entire United States was unusually large during February, being greater than in any February since 1918. Cutter and canner cows slaughtered for Government account contributed considerably to the large February total.

Shipments of feeder cattle and calves from South St. Paul were somewhat larger during the short month of February than they were in January and were much larger than in February last year. Since March 1, shipments have increased still further as compared to a year ago. As a result of the recent heavy shipments, the total for the year to date is almost as large as a year ago, despite the small shipments in January. One of the principal reasons for the steady, strong demand for feeder cattle was the

higher prices paid by packers for high quality fat cattle.

Hog receipts at South St. Paul in February clearly showed the effect of the AAA pig purchases last fall. Receipts during February, 1934, were much smaller than in the same month last year, despite a larger pig crop last spring than in the preceding year. Hog prices rose rapidly during February, reaching a new high since last October on the opening day of the last week of the month, February 26. Prices slumped badly on the following days, partly due to buyers' uncertainty as to the effect of the increase in the processing tax on March 1, and partly due to the low quality of the hogs received.

Marketings of hogs during February at all important slaughter centers evidently were a little below those of a year ago, as the total number of hogs slaughtered under Federal inspection was 6 per cent smaller than in February, 1933, and was smaller than in any February since 1927.

Receipts of sheep and lambs at South St. Paul during February were sharply reduced from January levels and from those of February last year. A smaller decrease was shown by the seven principal mid-western livestock markets. As a result of the decreased slaughter supplies, prices rose each week during the month, lifting the February medians considerably above those of the preceding month and to a point nearly twice as high as in February last year.

Cold Storage Holdings

The cold storage situation improved notably during March, especially in butter and pork. The heavy stocks of butter, which were responsible for the break in butter prices last November, have been rapidly diminishing. During February there was a disappearance from storage of 39 million pounds, which was more than half of the amount in storage at the beginning of the month. Of these withdrawals, 22 million pounds were for Government relief purposes, but the 17 million pounds which went into regular channels exceeded any February withdrawals during the past ten years. On March 1 stocks of butter were down to a level only 13 million pounds larger than the five year average for the first of March.

Stocks of pork in cold storage throughout the United States increased only 8 million pounds during February, whereas the five year average shows an increase of more than 100 million pounds during that month. Evidently the reduction in market supplies of hogs as a result of Government pig buying last fall, is now having a salutary effect on the storage situation. This is further evidenced by the fact that whereas on February 1 stocks of pork were 4 per cent above the five year average for that date, on March 1 stocks of pork were 8 per cent below the five year average for the date. Comparative improvement in stocks during February, although to a smaller extent, also occurred in cheese, poultry, beef,

lamb and mutton, miscellaneous meats and lard. The only commodities for which storage holdings were larger than the five year average on March 1 were butter, cheese, poultry and lard.

United States Cold Storage Holdings

(In thousands of pounds)

	March 1, 1934	March 1, 1933	March 1 5-year Average

Livestock on Farms, January 1

January 1 livestock holdings on farms in the four complete states of the Ninth Federal Reserve District were smaller than a year earlier, except in the case of dairy stock, according to a report recently issued by the United States Department of Agriculture. Cows and heifers kept for milk again increased during 1933, continuing the expansion of dairy farming which has been constant since 1926. Beginning with 1932, a new item was added to the livestock inventory record, figures on heifer calves to be kept for milk cows. On each January 1 since, the number of heifer calves has been larger than on the preceding January 1.

In the table below are the number of thousand head of each class of livestock included in the United States Department of Agriculture report for the four states, Minnesota, Montana, North Dakota and South Dakota combined, on January 1, 1934 and 1933, and the average for the years 1929-1933, together with percentage comparisons.

Livestock on Farms in Minnesota, North Dakota, South Dakota and Montana

(000's omitted in number of head)

	1934	1933	Per Cent of 1933	5-yr. Av.	Per Cent of 1934

*Including Calves.

Intentions to Plant

Undiscouraged by the smaller than normal amount of precipitation during the winter, farmers in the four complete states of the Ninth Federal Reserve District are planning to plant nearly as many acres as they planted last year and a little over 10 per cent more than they harvested last fall, according to the United States Department of Agriculture report of "Planting Intentions as of March 1, 1934." Basing their plans upon their experiences of the last few years, however, they intend to increase generously the acres devoted to the early season crops, which may mature some grain even if the moisture deficiency continues throughout the summer. Rye, barley and oats all show large increases over last year's harvested acreages, which had been greatly reduced owing to drouth abandonment.

Few of the farmers in our four states intend to increase flax acreages materially in 1934. The intended acreage is 23 per cent larger than the 1933 harvested acreage, but even with this increase, it will be smaller than in any other year since 1922, when there was a definite "stepping up" of flax acreage in our four states. On account of the small domestic flax marketings resulting from the 1933 crop failure one of the Minneapolis crushers was forced to import flaxseed from India during February. This is the first time that foreign flax has been crushed in Minneapolis since 1930.

Smaller intended increases were indicated for spring wheat and potatoes. Acreage reduction agreements with the AAA were largely responsible for a 4 per cent decrease in the intended corn acreage, and the acreage for tame hay was unchanged from that harvested last year.

In the entire United States, farmers intended to plant 4 per cent more acres than they harvested in 1933. In the United States as a whole, rye, barley and flax intended acreages showed the same large increases over 1933 harvested acres as in our four states because of the large proportion of the United States total acreage that is in our four states; spring wheat showed a decrease, despite the fact that 80 per cent of the acres planted to spring wheat are in our four states; oats and potatoes showed increases, and tame hay was unchanged. Corn was the only crop, besides spring wheat, that United States farmers intended to decrease below the 1933 harvested acreage.

Moisture Conditions

Since January 1, the amount of precipitation in each of the four complete states in the Ninth Federal Reserve District has been below normal. In South Dakota, a deficiency has been recorded each month during the winter, resulting in an accumulated deficiency nearly twice as great as in any other of our four states. Because of a large excess in the one month of December, Montana continues to show a small net excess over normal, but the other three

states now show deficiencies. The figures quoted below are averages of precipitation at all reporting stations within each state. It should be remembered that deficiencies at some stations are far greater than the state figures, and that some stations in Montana also have accumulated deficiencies.

	Precipitation (Inches)		
	Nov., 1933- Feb., 1934	Normal	Departure from Normal
Minnesota	2.72	3.41	— .69
Montana	3.76	3.45	+ .31
North Dakota	1.79	2.10	— .31
South Dakota	1.22	2.38	— 1.16

DISTRICT SUMMARY OF BANKING

The most recent banking reports reveal a continuation of the increase in deposits which has been under way since the bank holiday a year ago. Bank loans have continued to decrease and a large portion of the new deposits has remained as idle funds, either in the form of excess reserves with the Federal Reserve Bank or as balances due from correspondent banks. The growth in these totals of idle funds during the past year is shown by the table below. In this table, the first three columns show the excess reserves of licensed member banks in this district which have been carried in their reserve accounts with the Federal Reserve Bank. The figures are daily averages by months. The first two columns show these excess reserves subdivided into those carried by reserve city banks and those of country banks. Reserve city banks carry higher reserves against their demand deposits than the country banks are required to carry, and this is the primary basis for this classification of banks. However, since the reserve city banks include only the larger banks in Minneapolis and St. Paul and the banks at Helena, Montana, the group reflects fairly well the excess reserve condition of city banks in the district, whereas the country bank figures, which include all other member banks in the district, reflect chiefly the excess reserve condition of banks in the agricultural and mining regions.

Excess reserves carried with this Federal Reserve Bank have risen from \$4,800,000 in January, 1933, to more than \$21,000,000 in February, 1934. The greater part of the rise occurred after the passage of the Banking Act of 1933, which prohibited the payment of interest on correspondent bank balances. As a result there was no great profit motive to keep reserve balances with Federal reserve banks at the legal minimum. In previous periods when country banks had idle funds, these funds were chiefly deposited in central reserve banks in New York and Chicago, and the excess reserves with Federal reserve banks were only important in those centers.

Most of the recent increase in the excess reserves carried with this Federal Reserve Bank has occurred in the balances of country member banks, which in

February exceeded legal requirements by \$16,800,000. Reserve city banks have also been carrying increased amounts of excess reserves with the Federal Reserve Bank, but not to the same degree as has been true of the country banks.

The situation as to idle funds of banks in the Northwest is also revealed in two ways in the weekly reports made to this office by twenty city member banks in the district. As part of these weekly statements, the banks report the total of their balances due to other banks and their balances due from banks. The balances due to banks represent a portion of the correspondent balances of country banks in the Northwest, and to a considerable extent are comprised of the reserves of non-member banks. These balances have doubled since the bank holiday, and on March 14 were at the highest level since the spring of 1931, and were about \$6,000,000 higher than the average for the prosperous years 1926-1929. A portion of the increase in the last three weeks has been due to the deposit of tax money.

Balances due from banks, other than the Federal Reserve Bank, as reported by city member banks in the district, are chiefly balances carried by them with eastern correspondent banks. These balances have also increased sharply in the past few months, and on March 14, they were at the highest level since the summer of 1933 and much above the average of other recent years. Most of the increase in these balances in the last three weeks has been due to the deposit of tax funds. The figures for balances due to banks and balances due from banks for selected report dates near the middle of each month since January, 1933, are given in the last two columns of the following table.

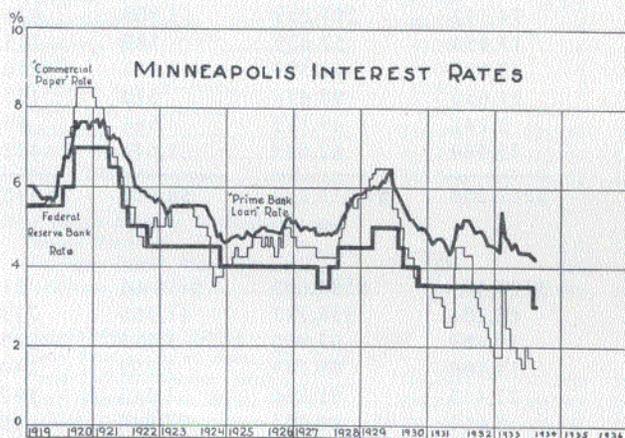

Excess Reserves and Correspondent Balances of Member Banks in the Ninth Federal Reserve District (In Millions of Dollars)

	Excess Reserve of Licensed Member Banks			Correspondent Balances of 20 Reporting City Member Banks	
	Reserve City Banks	Country Banks	Total Excess Reserves	Due to Banks	Due from Banks
January, 1933...	\$.6	\$ 4.2	\$ 4.8	\$59.8	\$73.8
February, 1933..	4.1	5.0	9.1	56.0	73.4

April, 1933.....	.9	8.6	9.5	57.8	57.7
May, 1933.....	.6	7.7	8.3	63.3	78.7
June, 1933.....	1.2	8.5	9.7	77.7	98.2
July, 1933.....	3.0	12.0	15.0	74.7	64.2
August, 1933...	2.2	13.2	15.4	67.7	55.1
September, 1933.	2.0	12.3	14.3	69.1	59.4
October, 1933...	1.9	12.2	14.1	73.1	58.2
November, 1933.	2.9	12.9	15.8	78.2	60.9
December, 1933.	4.0	14.5	18.5	75.0	62.5
January, 1934...	5.4	16.3	21.7	81.5	66.6
February, 1934..	4.3	16.8	21.1	85.0	75.4
March, 1934....	95.7	89.7

Country bank deposits, as represented by deposits of member banks in the district located in cities with less than 15,000 population, increased \$9,000,000 between the daily average for January and the daily average for February. A portion of the increase in deposits from January to February as in earlier months, was the result of the inclusion of figures for a number of new member banks in the February figures, but even excluding figures for these newly added banks, the deposit increase in February was the largest on record for that month. The country member banks which were licensed immediately after the bank holiday have gained \$24,000,000 (10 per cent) in deposits since the holiday.

City member banks experienced an increase of \$15,000,000 in total deposits during the four weeks ending March 14. This increase was chiefly the result of the deposit of tax funds, which was evidenced by increases in deposit balances of municipalities, and in balances due to country banks. Total deposits of city member banks on March 14 were the highest since the fall of 1931. Loans to customers by city member banks decreased \$2,000,000 during the four weeks ending March 14, and investment holdings increased \$5,000,000.

Interest rates at Minneapolis dropped to new low levels during March. The weighted average rate charged by leading Minneapolis banks on prime loans to customers decreased to less than 4 1/4 per cent, which was the lowest rate quoted in the history of this series, which extends back through 1919. The discount rate of this Federal Reserve Bank was reduced to 3 per cent on March 16. The previous rate, which was 3 1/2 per cent, had been effective since September, 1930. The new rate is the lowest which this bank has ever made. The rate to borrowers quoted by a leading commercial paper house decreased to 1 1/2 per cent for all maturities during March. This was equal to the lowest rate previously quoted for shorter maturities and was the lowest rate in our record for longer maturities.

Interest Rates at Minneapolis on Prime Bank Loans and Commercial Paper and the Discount Rate at the Federal Reserve Bank, 1919-1934.

BANKING DURING 1933

The banks of the district fared very well during 1933, when it is considered that so many unexpected and trying events occurred in that year. The decrease in deposits during the first half of the year, including the amount of deposits removed from the total by the failure of banks to reopen after the bank holiday, amounted to \$80,000,000. In the last half of 1933, a small recovery of deposits occurred, amounting to \$4,000,000, so that the net loss in deposits of operating banks during the year was \$76,000,000, and total deposits in going member and non-member banks in the district at the end of 1933, amounted to \$1,013,000,000.

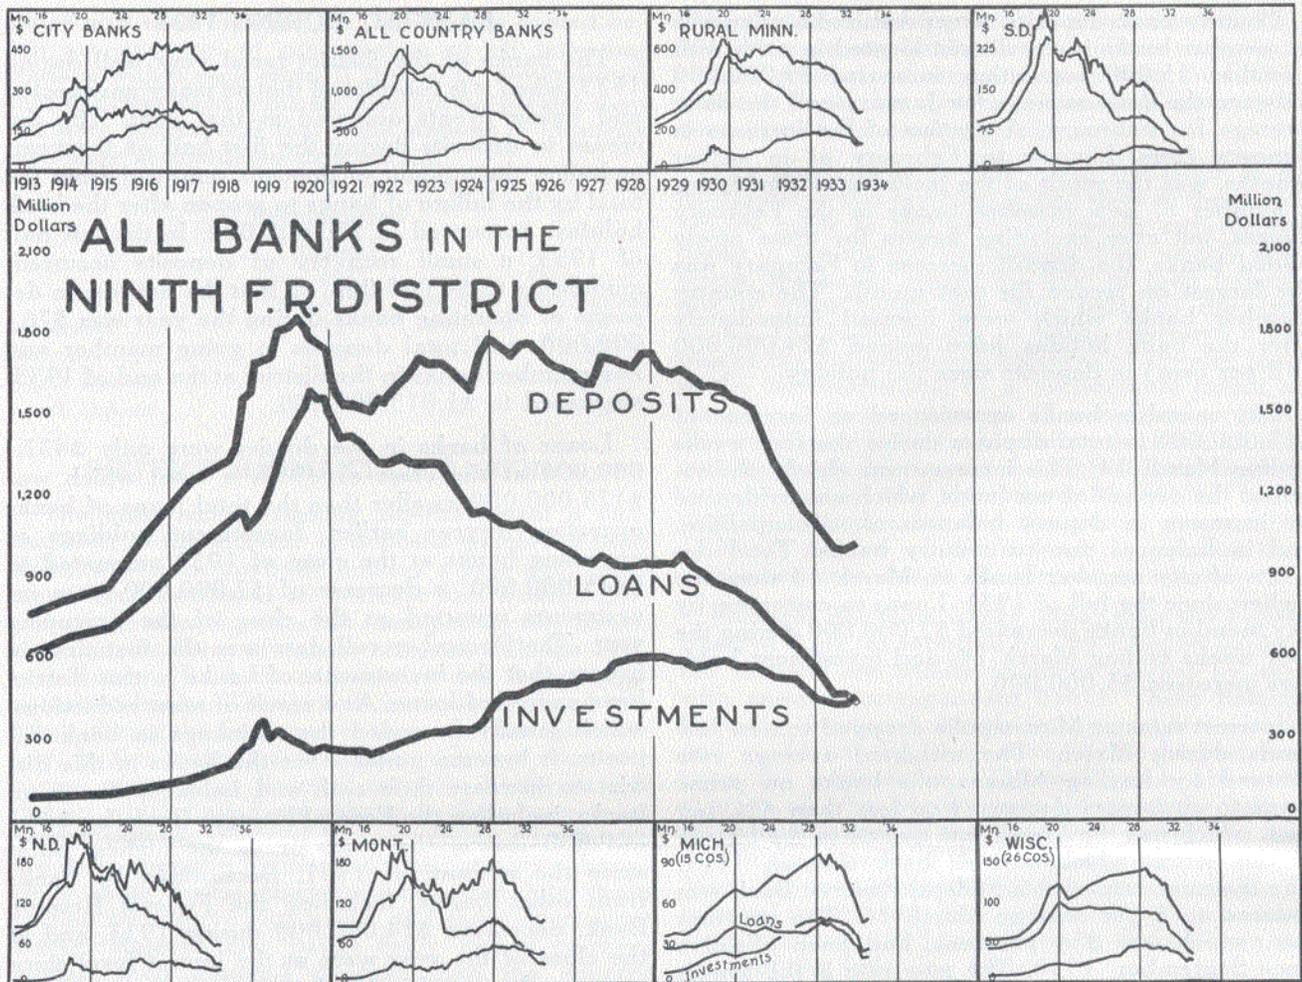

Loans of banks in the district were only \$437,000,000 at the close of 1933, a total which was \$123,000,000 smaller than the total loans of banks operating a year earlier. Investment holdings of operating banks at the close of 1933 amounted to \$445,000,000, a decrease of \$7,000,000 from investments reported at the close of the preceding year. The December call date was the first time in history that the investments of banks in this district have exceeded loans. As a result of asset reductions, which greatly exceeded the shrinkage in bank deposits, it became possible for the banks in this district to increase their cash and balances due from banks, including the Federal Reserve Bank, by \$26,000,000 during the year, or to the highest point since the summer of 1931. Borrowings by banks from other banks, including the Federal Reserve Bank, decreased \$24,000,000 during 1933, and at the close of the year were at the lowest level since our records started in 1914.

The city banks fared relatively better than the country banks during 1933. At city banks, there was an increase of \$8,000,000 in deposits and a reduction of \$12,000,000 in loans. Investment holdings were increased \$19,000,000 and cash and balances due from banks were increased \$3,000,000. City banks were practically out of debt throughout the year.

Country banks experienced decreases of \$84,000,000 in deposits, \$111,000,000 in loans and \$25,000,000 in investments. Nevertheless, they were able to increase their cash and balances due from banks \$23,000,000 and to reduce their borrowings \$24,000,000.

The number of banks in operation in the Ninth Federal Reserve District, according to the records of our Transit Department, decreased from 1,685 in 1932 to 1,449 in 1933. It will be noted that this number of banks is larger for both dates than the number reported in the accompanying table, which shows only those banks whose statements were reported to the various supervisory authorities for inclusion in the abstracts of called reports.

(Chart and table on following page)

*Figures for a smaller number of banks

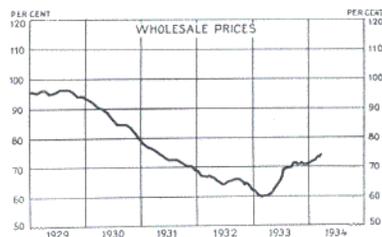

Summary of National Business Conditions (Compiled March 24 by Federal Reserve Board)

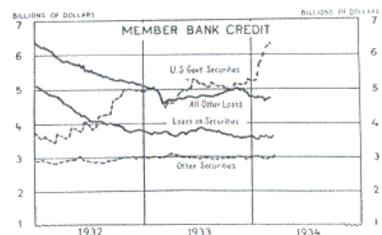

Index number of industrial production, adjusted for seasonal variation. (1923-1925 average=100.)

Indexes of factory employment and payrolls, without adjustment for seasonal variation. (1923-1925 average=100.)

Index of United States Bureau of Labor Statistics. (1926=100.) By months 1929 to 1931; by weeks 1932 to date. Latest figure is for week ending March 17.

Wednesday figures for reporting member banks in 90 leading cities. Latest figures are for March 14.

The volume of industrial activity increased in February for the third consecutive month and there was a considerable growth in factory employment and payrolls. Wholesale commodity prices, after advancing for two months, showed little change between the middle of February and the middle of March.

PRODUCTION AND EMPLOYMENT: Output of manufactures and minerals, as measured by the Board's seasonally adjusted index of industrial production, increased from 78 per cent of the 1923-1925 average in January to 81 per cent in February. The advance reflected chiefly increases of considerably more than the usual seasonal amount in the output of steel and automobiles, while activity at meat packing establishments declined. Activity at textile mills, which in January had increased from the low level prevailing at the end of the year, showed a further moderate increase in February, partly of seasonal character. In the first week of March, steel production showed a further increase and in the following two weeks remained unchanged.

Factory employment and payrolls increased substantially between the middle of January and the middle of February to a level higher, on a seasonally adjusted basis, than at any other time since the summer of 1931. Working forces on railroads also showed an increase, while at mines there was little change in the volume of employment. The number on the payrolls of the Civil Works Administration declined from about 4,000,000 in January to about 2,900,000 in the week ending March 1. At automobile factories, there was a large increase in the number employed to approximately the level prevailing four years ago. Substantial increases were reported also for the textile, clothing, shoe and tobacco industries.

The value of construction contracts awarded, as reported by the F. W. Dodge Corporation, showed a decline in February, followed by an increase in the first half of March. The total volume indicated for the first quarter is somewhat smaller than in the last quarter of 1933, but considerably larger than in the first quarters of 1932 and 1933.

DISTRIBUTION: Freight traffic increased seasonally during February and the early part of March. The dollar volume of department store sales on a daily average basis showed little change in February.

DOLLAR EXCHANGE: The foreign exchange value of the dollar in relation to gold currencies declined in the second week of February to within 2 per cent of its new parity, and in the latter part of February and the first three weeks of March showed a further slight decline.

COMMODITY PRICES: Wholesale prices of commodities showed little change from the middle of February to the middle of March, after a considerable increase earlier in the year. The index of the Bureau of Labor Statistics for the week ending March 17 was at 73.7 per cent of the 1926 average, compared with 73.8 per cent the week before and 72.4 per cent at the end of January.

BANK CREDIT: Between the middle of February and the third week of March, imports of gold from abroad resulted in a growth of about \$550,000,000 in the country's monetary gold stock. Funds arising from these imports of gold and from expenditure by the Treasury of about \$140,000,000 of its cash and deposits with the Federal Reserve banks were for the most part added to the reserves of member banks, which consequently increased by \$600,000,000 during the four-week period. At the close of the period, member bank reserves were nearly \$1,500,000,000 in excess of legal requirements. Total deposits of reporting member banks increased by about \$1,000,000,000 between the middle of February and the middle of March, reflecting the imports of gold, purchases by the banks of United States Government and other securities, and a growth of bankers' balances.

During March, money rates in the open market declined further. Rates on 90-day bankers' acceptances were reduced from $\frac{1}{2}$ per cent to $\frac{1}{4}$ per cent, and rates on prime commercial paper were reduced by $\frac{1}{4}$ per cent to a range of 1-1 $\frac{1}{4}$ per cent. Yields on United States Government securities also declined considerably. On March 16, the Federal Reserve Bank of Minneapolis reduced its discount rate from $3\frac{1}{2}$ to 3 per cent.
